CPE

Information leaflet
for **Contacts**, their
Families and Carers

What is CPE?

The gut of every normal, healthy human contains bacteria (bugs) called enterobacteriales. They do no harm, however if they get into the wrong place, such as the bladder or bloodstream, they can cause infection.

They do not cause diarrhoea, vomiting or tummy upset. CPE (Carbapenemase-Producing Enterobacteriales) used to be called CRE, are a particular type of common gut bacteria that are resistant to antibiotics.

CPE have developed a resistance to a powerful group of antibiotics called carbapenems. Carbapenems are an important group of antibiotics that doctors often rely on to treat infections where treatment with other common antibiotics will not work. However it is important to know there are still some antibiotics that do work against CPE.

What is a CPE Contact?

You are referred to as a **CPE contact** if you have spent a number of hours in the same hospital space with someone who is carrying CPE in their gut.

Being a **CPE contact** does not mean that you are carrying CPE in your gut. However it does mean that the chances of you picking it up are higher as you have shared a space with someone who was carrying CPE in their gut.

If you are a CPE contact and come into hospital there is a note on your record and you will be offered testing for CPE. The staff will use special precautions when caring for you which may or may not include apron/gown or gloves.

If you are a CPE contact we may also share this information with other hospitals. This is a precaution to prevent further spread of CPE.

Should I be tested?

The advice from the HSE recommend that **CPE contact** patients get tested only if they are in hospital or going to be admitted to hospital.

Outside of the hospital setting we do not recommend that you do anything different in your daily life and so there is very little benefit to being tested.

What does testing involve?

Testing for CPE in hospital usually means taking a rectal swab (a sample taken by inserting a small swab briefly just inside the back passage). Another way to do this is to ask you to give a sample of poo (faeces). The testing for **CPE contacts** generally means four samples taken over at least, a four week period (samples taken with at least one week between samples). These samples will be tested in the laboratory.

The result from each test may be ready in a day or two and generally should not take more than a few days. If CPE is not found in any of the four samples you are no longer identified as a CPE contact. There will no longer be any need for special infection control measures in your care when you are in the Hospital unless there are other reasons to do so.

The note can be taken off your hospital record and if you have a CPE contact card you can dispose of it.

Do I have to stay in hospital for four weeks for the tests to be done?

No. The testing is only recommended as necessary for patients who are in hospital. If you are well enough to be discharged you can go home.

Do I need to worry about coming into contact with others when I am at home or out in public?

No. There is no need to do anything different from anyone else as you go about your daily life. Just as for everybody else we recommend that you are careful about cleaning your hands. In relation to using the toilet it is really important that everyone leaves the toilet clean. Everyone should clean their hands after using the toilet, before eating or preparing food.

Should I use a separate bathroom?

There is no need for you to use a separate bathroom. Following good hand washing practice all of the time helps all of us to prevent spread of bacteria and viruses of all types, not just CPE.

Should I use a separate bathroom?

There is no need for you to use a separate bathroom. Following good hand washing practice all of the time helps all of us to prevent spread of bacteria and viruses of all types, not just CPE.

Do I need to launder my clothes separately or use different dishes/cutlery?

There is no need to do anything different with laundry, dishes or cutlery.

Can I share the bed with my partner who is immunocompromised?

There is no need to sleep in separate beds. There is no need to avoid or limit physical or intimate contact.

If no precautions are required at home, do I have to tell anyone?

There are special precautions that are put in place if you are in a healthcare setting. This is because there are other patients who are sick and their immunity is low. For this reason we recommend you tell any healthcare provider that you are a CPE contact. Outside of a healthcare setting it is up to you who you tell.

If I test positive for CPE will I become sick?

CPE causes no harm as long as it stays in the gut. It does not cause diarrhoea, vomiting or tummy upset.

The risk of a person carrying CPE developing a serious CPE infection is very low. For the small number of people who do develop a serious CPE infection there are antibiotics that work and doctors use these antibiotics early if they know the patient is carrying CPE.

If I test positive for CPE can I take an antibiotic to get rid of it?

No. Antibiotics will not remove CPE from your gut. Antibiotics can actually make CPE stay in the gut longer as antibiotics kill off normal gut bugs and make the gut a better home for CPE.

Where can I find more information?

If you would like any further information, please speak to a member of your healthcare team and refer to our CPE positive patient information leaflet. For more information on antimicrobial resistance and healthcare acquired infection or to view CPE guidance check www.hse.ie/hcai

How can I contact a member of the Infection Prevention & Control Team?

Tell the Clinical Nurse Manager, Doctor or Nurse looking after you if you would like to speak to a member of the Infection Prevention & Control Team and they will contact us.

We have made every possible effort to make sure that all the information provided in this leaflet is true, accurate, complete and up to date at the time of publication.
